EXPERIMENT - 11

Deployment of Zoho Creator Application from Development to Stage and Production

Student Name	Lalitha B
Roll Number	241401045
Department	CSBS
Experiment Number	11
Platform	Zoho Creator
Application Name	Recruitment & Job Application Management

1. Aim

To understand the multi-stage deployment process in Zoho Creator by modifying the Recruitment & Job Application Management application in Development, preparing the changes for Stage testing, and learning the process for publishing a validated version to Production.

2. Introduction

Zoho Creator provides Development, Stage, and Production environments. Development is used to build and change an application, Stage is used to validate changes before release, and Production is used by authorized end users. Reviewing and testing changes before deployment reduces the risk of introducing unwanted changes into a live recruitment application.

3. Application Details

Form	Job application form
Report	All Job Applications
Related page	Recruitment Analytics Dashboard
Change used for the exercise	Add Notes field with a pre-submission verification instruction
Deployment path	Development to Stage to Production

4. Procedure

Step 1 - Open the application: Log in to Zoho Creator, open Recruitment & Job Application Management and enter the application builder in Development mode.

Step 2 - Modify the application form: Open Design > Job application form. Drag the Add Notes component into the form. In Field Properties, replace the default placeholder with instructions asking candidates to verify personal, contact, employment and experience information before submission. Save

the configuration.

Step 3 - Check the form in Development Live: Open Access Development Live and inspect the new note alongside the existing candidate fields. Confirm that the note has the intended text and placement.

Step 4 - Open deployment environments: Return to the Zoho Creator dashboard. Select Deploy > Environments and locate the recruitment application.

Step 5 - Publish changes to Stage: Choose Publish to Stage, select the changed form components, review the Development versus Stage comparison, enter a descriptive deployment title and choose Minor if offered. Publish the package.

Step 6 - Test in Stage: After the Stage publishing process completes, open Stage Live. Confirm that the updated note appears and the form remains usable.

Step 7 - Publish to Production: If Stage testing is successful, select Publish to Production for the tested version. Review the components and confirm the publication.

Step 8 - Verify Production: Open Production Live and check that the updated form and report are accessible with the expected behavior.

5. Implementation Evidence

The following screenshots document the form edit and the Development Live view provided for this experiment. They do not, by themselves, verify a completed Stage or Production deployment.

Figure 1 - Adding Notes in Form Builder

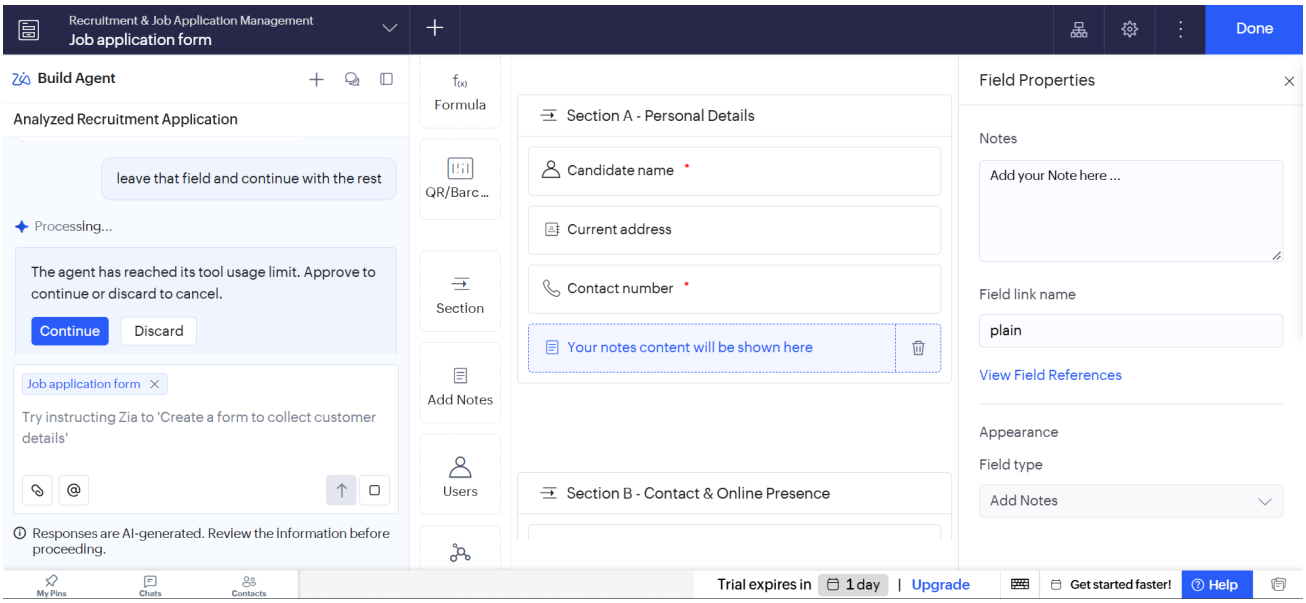

Figure 1. Add Notes field selected within the Job application form, with Field Properties visible. The screenshot still displays the default note placeholder.

Figure 2 - Viewing the Form in Development Live

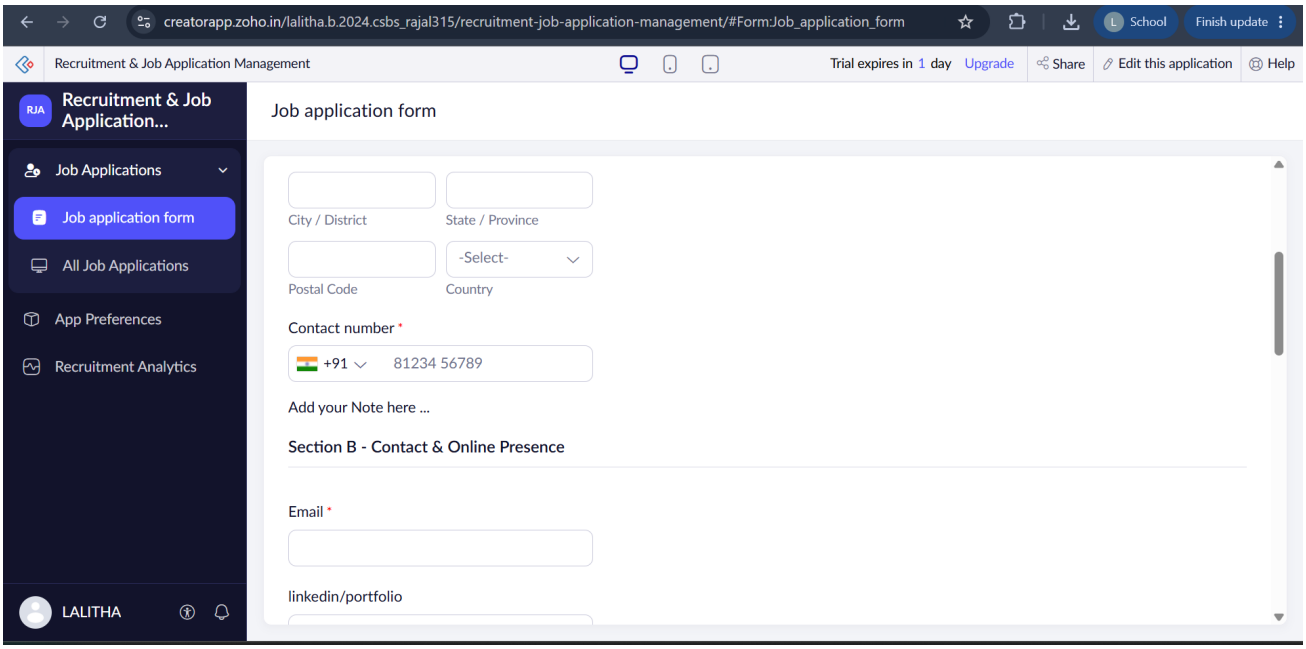

Figure 2. Job application form opened in Development Live. The added note appears above Section B, still showing the placeholder text "Add your Note here ...".

6. Deployment Verification Checklist

Development	Form note added; screenshot captures the default placeholder, so finalized instruction text is not confirmed.

Stage	Check the publishing status and verify the modified form in Stage Live.
Production	Confirm the tested version is published and visible in Production Live.

7. Observations and Result

The Add Notes component was inserted into the Recruitment & Job Application Management form and was visible in the development form view. The attached evidence shows the note field but not the finalized verification instruction; it also does not show Stage or Production deployment confirmation. Therefore, the documented result is successful insertion and visibility of the note component, with final note configuration and deployment verification remaining to be evidenced.

8. Conclusion

This experiment explains how an existing Zoho Creator application can be modified and moved through Development, Stage and Production in a controlled process. The provided implementation evidence illustrates the initial modification and development preview. Completing a full deployment demonstration requires checking the final note text, publishing to Stage, testing the Stage version, and verifying the subsequent Production release.
