EXPERIMENT - 8

Configuring User Management and Role-Based Access Control (RBAC) in Zoho Creator

Recruitment & Job Application Management

Details	Information
Student Name	Lalitha B
Roll Number	241401045
Department	CSBS
Experiment Number	8
Platform	Zoho Creator
Application Name	Recruitment & Job Application Management

1. Aim

To configure user management and role-based access control in the Recruitment & Job Application Management application using Zoho Creator, by defining HR Manager and HR Staff roles, creating permission sets for recruitment operations, and reviewing application users.

2. Objectives

The objectives are to organize an HR reporting hierarchy; establish separate full-access and limited-access permission profiles; manage users who may access the application; and understand the difference between roles, permission sets, and record visibility.

3. Software and Tools Required

Zoho Creator (web-based low-code platform), the existing Recruitment & Job Application Management application, a browser, and a Zoho account with permission to administer the application.

4. Introduction / Theory

User management determines which users can access an application. **Roles** establish the reporting hierarchy and influence the records a user can see. **Permission sets** specify which actions are allowed on forms, reports, and other components. **Data Sharing** can extend visibility beyond normal role-based access rules.

5. Application Specifications

Component	Details
Existing application	Recruitment & Job Application Management
Form	Job application form
Report	All Job Applications
Roles	CEO > HR Manager > HR Staff

Component	Details
Custom permission profiles	HR Manager Permissions; HR Staff Permissions
User administration	Manage > Users

6. Procedure

Step 1 - Open User Permissions. Open the application builder, select Settings, and navigate to User Permissions. The three main controls are Permissions, Roles, and Data Sharing.

Step 2 - Create HR Manager. Select Roles and Add Role. Enter HR Manager as the role name and CEO as the parent role; add a description and save.

Step 3 - Create HR Staff. Add another role named HR Staff, choose HR Manager in Reports To, and save. The resulting hierarchy is CEO > HR Manager > HR Staff.

Step 4 - Configure permission profiles. Open the Permissions tab and create HR Manager Permissions with full recruitment-record management access, and HR Staff Permissions with limited access. Allow appropriate view, add and edit operations while withholding delete privileges from HR Staff.

Step 5 - Review user access. Open Manage > Users to review the available user accounts and invitations. User records should be assigned the relevant application role and permission set before access testing.

Step 6 - Verify and test. Use separate non-administrator test accounts to verify permitted operations, especially whether HR Staff is prevented from deleting records. Review Data Sharing separately if additional record visibility is required.

7. Planned Access-Control Matrix

Operation	HR Manager	HR Staff
Create job applications	Allow	Allow
View job applications	Allow	Allow (within granted visibility)
Edit job applications	Allow	Allow (within granted visibility)
Delete job applications	Allow	Deny
View candidate report	Allow	Allow

Note: The matrix describes the intended policy. The screenshots confirm the existence of roles and named permission sets, but do not display the detailed operation-level settings or a completed role-based login test.

8. Implementation Evidence

The following screenshots are captured from the Recruitment & Job Application Management configuration and Zoho Creator user administration screens.

Figure 1 - Role Hierarchy

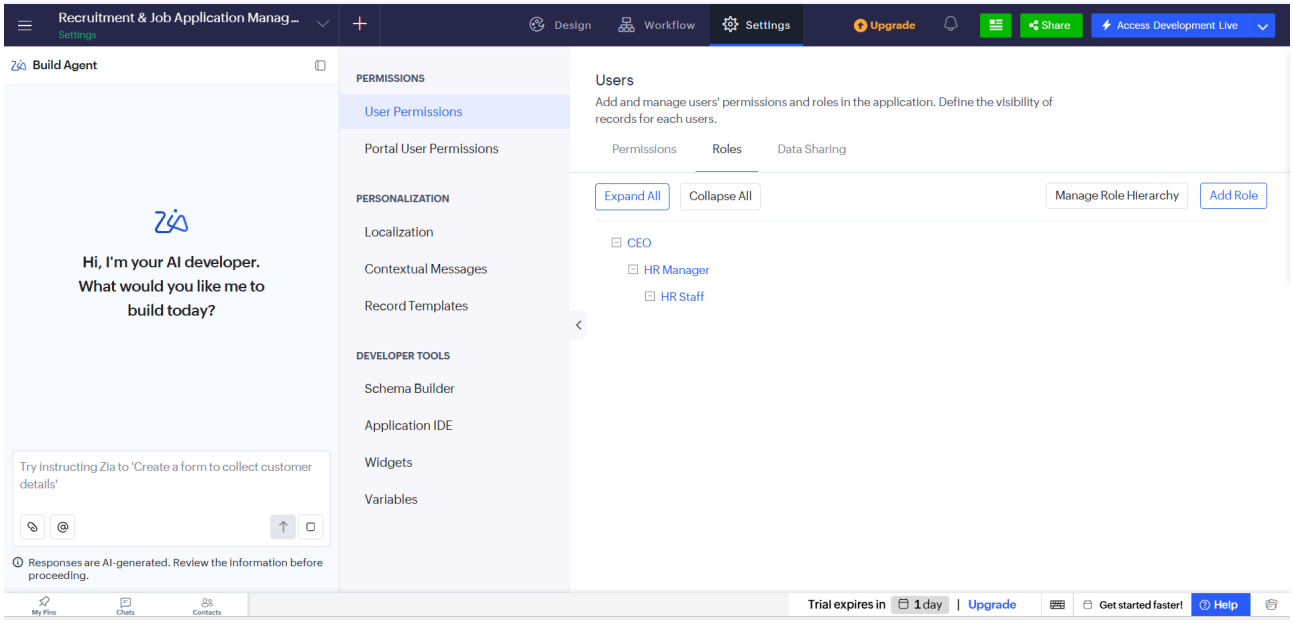

Figure 1. The Roles tab shows CEO, HR Manager and HR Staff in a reporting hierarchy.

Figure 2 - Permission Profiles

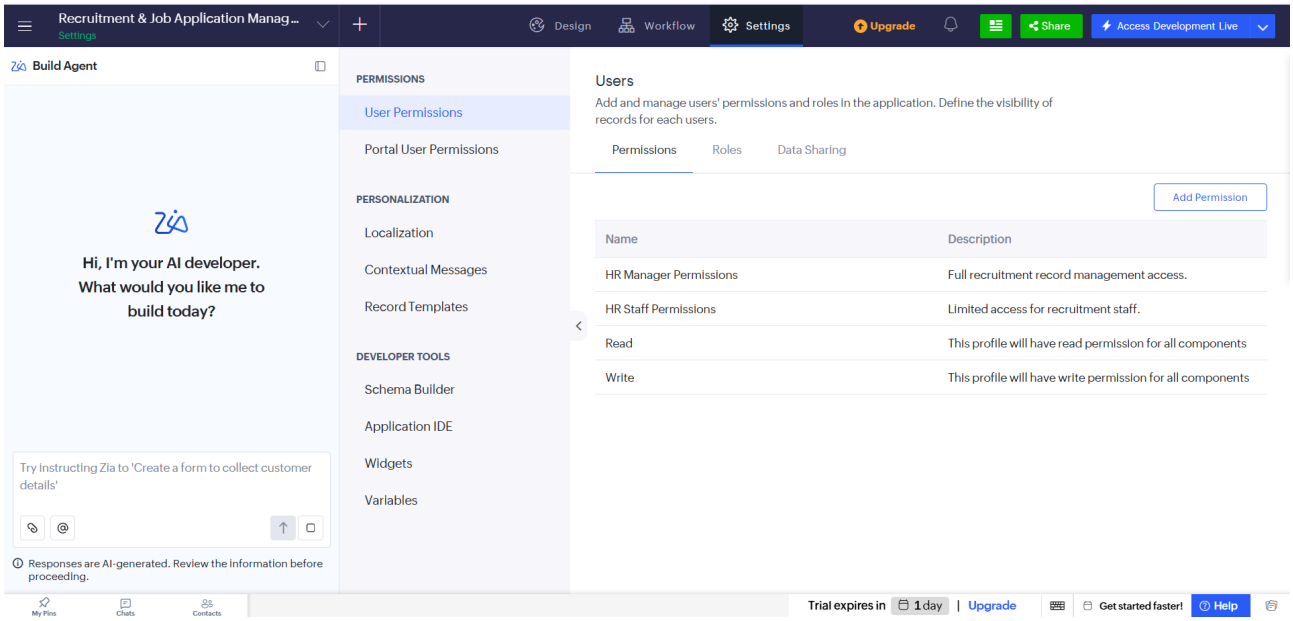

Figure 2. The Permissions tab lists HR Manager Permissions and HR Staff Permissions alongside the default Read and Write profiles.

Figure 3 - User Management

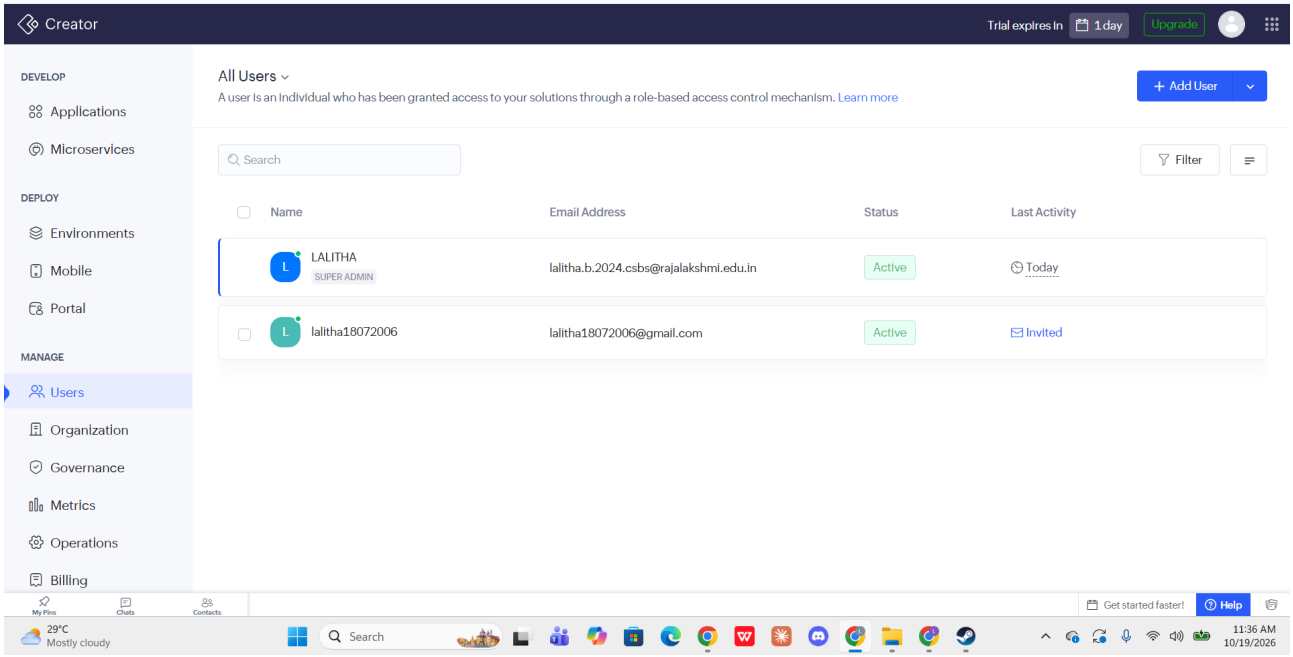

Figure 3. The Users page displays an active Super Admin account and an additional active account with an invitation indicator.

9. Observations and Verification

The role hierarchy contains CEO, HR Manager and HR Staff. Two named permission profiles are present for the recruitment application. The Zoho Creator Users page shows an administrator and another user record. These images provide configuration evidence, although they do not establish which profile was assigned to the second user or demonstrate restricted record operations.

10. Result

The HR Manager and HR Staff roles and their respective permission sets were created in the Recruitment & Job Application Management application. User management was reviewed in Zoho Creator. Additional verification with separate assigned test accounts is required to confirm that HR Staff cannot delete job application records.

11. Conclusion

This experiment demonstrates the setup of role-based access control in a low-code recruitment application. Defining a hierarchy and separate permission profiles provides a foundation for controlled access to candidate information and for future testing of the HR Manager and HR Staff privileges.
