EXPERIMENT - 9

Exploring AI-Assisted Features and Built-In Analytics (Zia) in Zoho Creator

Recruitment & Job Application Management

Particulars	Details
Student Name	Lalitha B
Roll Number	241401045
Department	Computer Science and Business Systems (CSBS)
Experiment Number	9
Platform	Zoho Creator
Application Name	Recruitment & Job Application Management

1. Aim

To explore Zoho Creator's Zia AI-assisted capabilities and built-in analytics using the existing Recruitment & Job Application Management application, and to create a recruitment analytics dashboard that summarizes submitted job applications by department, employment type, and other candidate attributes.

2. Objectives

• Explore the Zia Build Agent within the existing Zoho Creator application.

• Examine the Job application form and All Job Applications report as sources of recruitment data.

• Generate suggestions for meaningful recruitment metrics and visualizations.

• Create a Recruitment Analytics Dashboard with summary panels and charts.

• Review the dashboard design and identify items requiring validation with actual records.

3. Software / Tools Required

Zoho Creator; Zia Build Agent (as available in the account); web browser and internet access; existing Recruitment & Job Application Management application.

4. Introduction / Theory

Built-in analytics: Zoho Creator enables records from forms and reports to be presented as key metrics and visual components, such as count panels, pie charts, and column charts. These can help recruitment staff observe application distribution and monitor trends.

Zia AI assistant: The Zia Build Agent can analyze an application's structure and propose or construct components from natural-language prompts. Suggested insights should be checked against the underlying records rather than assumed to be validated statistics.

5. Application Specifications

Parameter	Details
Application	Recruitment & Job Application Management
Form	Job application form
Report	All Job Applications
Analytics Page	Recruitment Analytics Dashboard
Candidate Fields	Department Applied For, Employment Type Preferred, Years of Experience, Key Skills
Dashboard Components	Total applications; department-wise and employment-type panels; department pie chart; employment-type column chart; additional analytics sections

6. Procedure

Step 1 - Open the application: The Recruitment & Job Application Management application was opened in Zoho Creator and its existing Job application form and All Job Applications report were reviewed.

Step 2 - Access Zia: The Build Agent panel was accessed from the application builder to explore AI-assisted recruitment analytics.

Step 3 - Analyze application data: Zia was prompted to examine the form structure, including department, employment type, experience, and skills fields, and suggest relevant analytics. The displayed analysis identified fields and proposed possible metrics.

Step 4 - Generate insights: The assistant suggested recruitment analytics such as department-wise application distribution, employment-type preferences, experience distribution, and skills-related measures.

Step 5 - Create visualizations: Zia created a Recruitment Analytics Dashboard page with metric panels and charts, which was displayed in the application builder.

Step 6 - Improve the dashboard: The dashboard was opened in Page Builder and its panels, forms, and chart layout were reviewed and configured.

7. Implementation Evidence

The following screenshots document the Zia analysis and dashboard construction through Step 6. They show the builder configuration; actual numeric values and live behavior must be verified separately.

Figure 1 - Zia Analysis and Dashboard Preview

The Zia Build Agent summarizes the existing recruitment application structure and shows a newly created Recruitment Analytics Dashboard with summary panels and visual components.

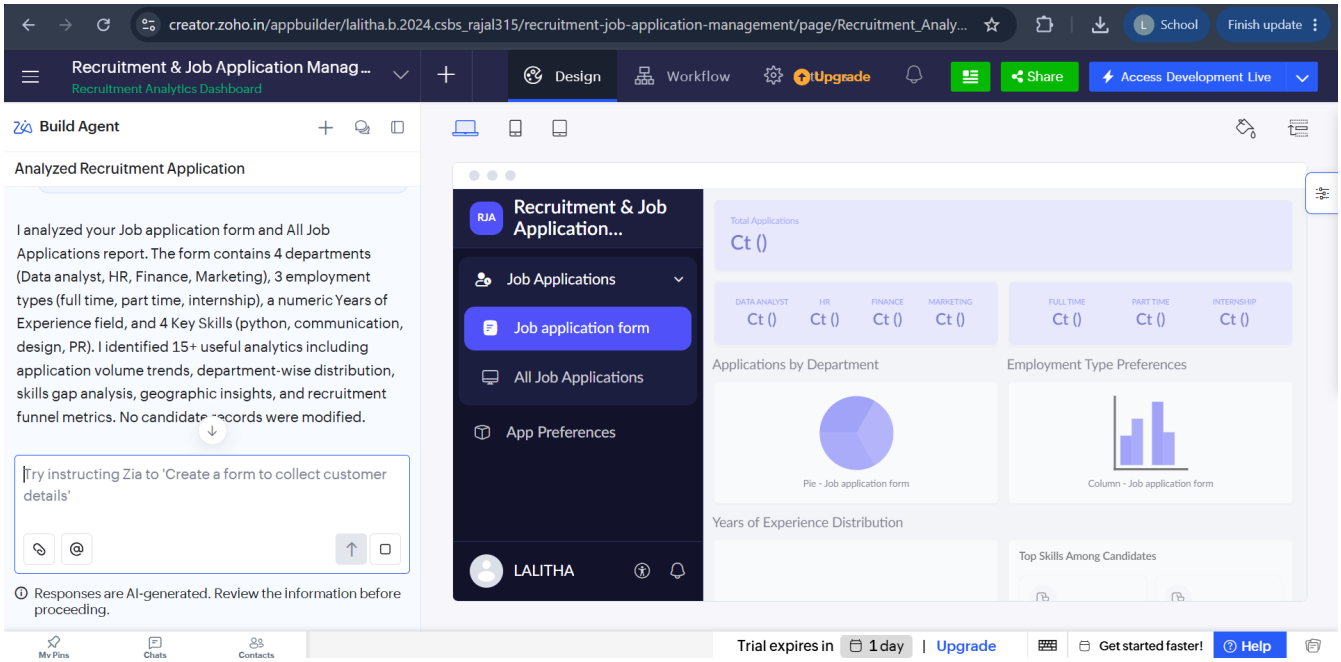

Figure 1. Zia analysis and Recruitment Analytics Dashboard preview.

Figure 2 - Dashboard Component Configuration

The Page Builder provides controls for inserting or configuring components, including forms, reports, panels, and charts. The Build Agent confirms the dashboard page was created.

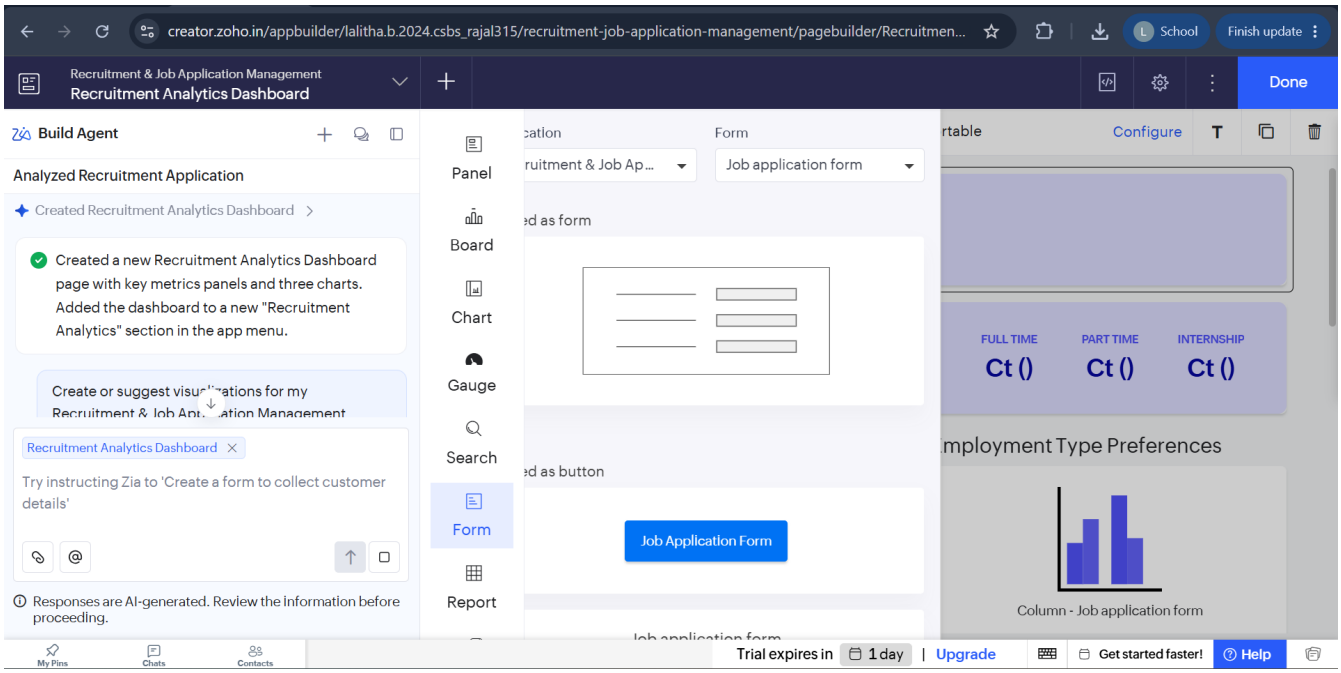

Figure 2. Recruitment Analytics Dashboard opened in Page Builder for component configuration.

Figure 3 - Summary Panels and Recruitment Charts

The configured dashboard contains summary areas for total applications, department categories, and employment types, along with department and employment-type visualization components.

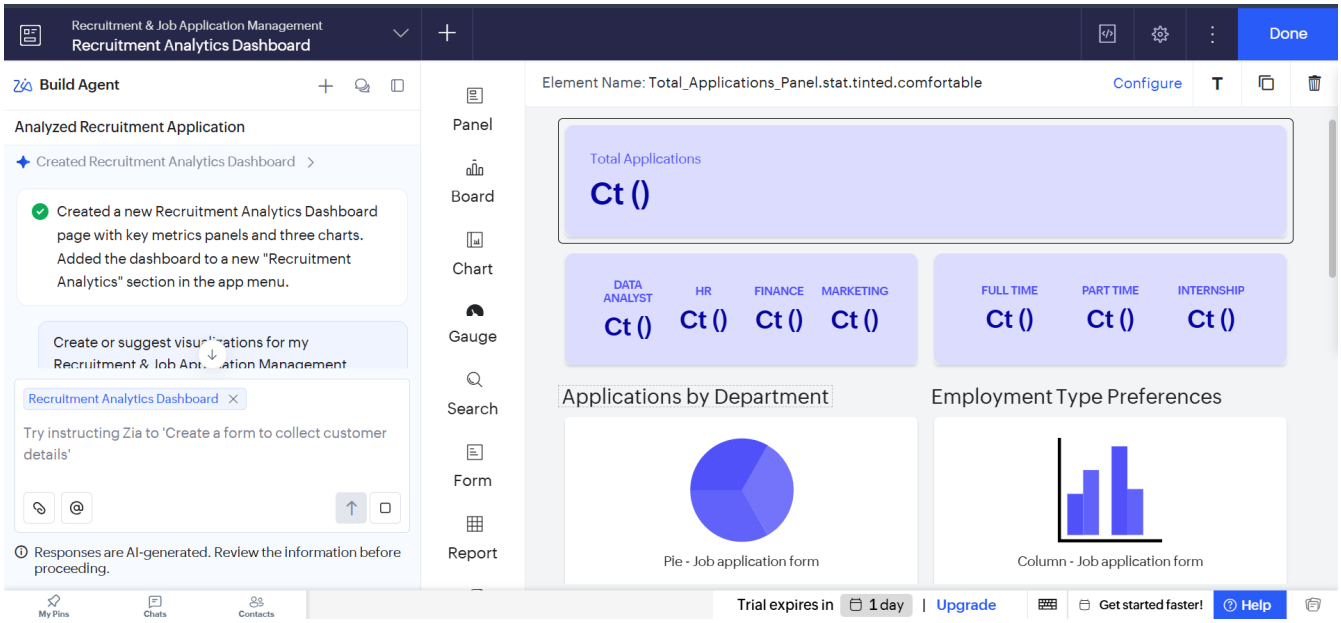

Figure 3. Recruitment dashboard showing summary panels and chart placeholders in the builder.

8. Observations and Verification

Zia reported identifying fields and potential recruitment analytics, and the dashboard page was generated. However, the captured panels show the expression **Ct()** rather than confirmed numeric totals, and the charts appear in the builder as design previews. Therefore, these screenshots demonstrate dashboard creation and configuration, not verified live analytics. Testing against the underlying All Job Applications records remains necessary.

9. Result

The Zia Build Agent was explored and a Recruitment Analytics Dashboard was created within the Recruitment & Job Application Management application. Summary panels and chart components were added and reviewed through Step 6. Live record-count verification was not documented in the supplied screenshots.

10. Conclusion

This experiment illustrates how AI-assisted application building and built-in analytics can support recruitment reporting in Zoho Creator. The created dashboard provides a foundation for department, employment-type, experience, and skills analysis. Connecting and validating each metric with actual candidate records is the next step toward a reliable recruitment analytics dashboard.
