EXPERIMENT - 7

Integrating a Zoho Creator Application with Another Zoho Service Using Connections and APIs

Recruitment & Job Application Management

Student Name	Lalitha B
Roll Number	241401045
Department	Computer Science and Business Systems (CSBS)
Experiment Number	7
Platform	Zoho Creator
Application Name	Recruitment & Job Application Management

1. Aim

To integrate the Recruitment & Job Application Management application in Zoho Creator with Zoho Calendar through an authorized connection and a Deluge workflow. The intended automation is to create a proposed interview event in Zoho Calendar when a new job application is successfully submitted.

2. Problem Statement

Recruitment teams often need to transfer proposed interview details from candidate application forms into a calendar. Manual entry consumes time and can introduce scheduling mistakes. Integrating Zoho Creator with Zoho Calendar offers a way to transfer date, time and department details from a submitted application into a calendar event.

3. Application and Integration Details

Source Application	Recruitment & Job Application Management
Source Form	Job application form
Target Service	Zoho Calendar
Workflow Trigger	Record Created - Successful form submission
Workflow Name	Create Job Interview Calendar Event
Connection	Job Interview Calendar Connection
Automation Goal	Create a proposed job interview calendar event

4. Procedure

Step 1 - Open Microservices: Open Zoho Creator, go to Develop, choose Microservices, and select Create New.

Step 2 - Select Connections: Choose Connections from the available microservice options and search for Zoho Calendar.

Step 3 - Configure and Authorize the Connection: Specify the connection name and link name, select the necessary calendar-event permissions, and authorize access using the Zoho account.

Step 4 - Enable Application Access: Enable the Zoho Calendar connection for the Recruitment & Job Application Management application.

Step 5 - Create the Workflow: In the app builder, create a workflow for Job application form, selecting Created and Successful form submission as the trigger.

Step 6 - Add a Deluge Action: Open Add New Action, select Always, and choose Deluge script to configure the calendar event creation logic.

Step 7 - Configure Event Details: Use the proposed interview date and time, department, calendar UID and authorized connection link name in the script. Save the script after resolving syntax errors.

Step 8 - Test the Integration: Submit a new sample job application and open the connected calendar to check whether an event has been created for the proposed interview date and time.

5. Integration Workflow

Job Application Form submission Zoho Creator workflow Deluge event-creation action Zoho Calendar connection Proposed Interview Calendar Event.

6. Implementation Evidence

The screenshots below document the workflow action selection, Deluge editor debugging stage and Zoho Calendar interface. They demonstrate configuration and testing activity; they do not, by themselves, verify successful event creation.

Figure 1 - Selecting the Deluge Script Action

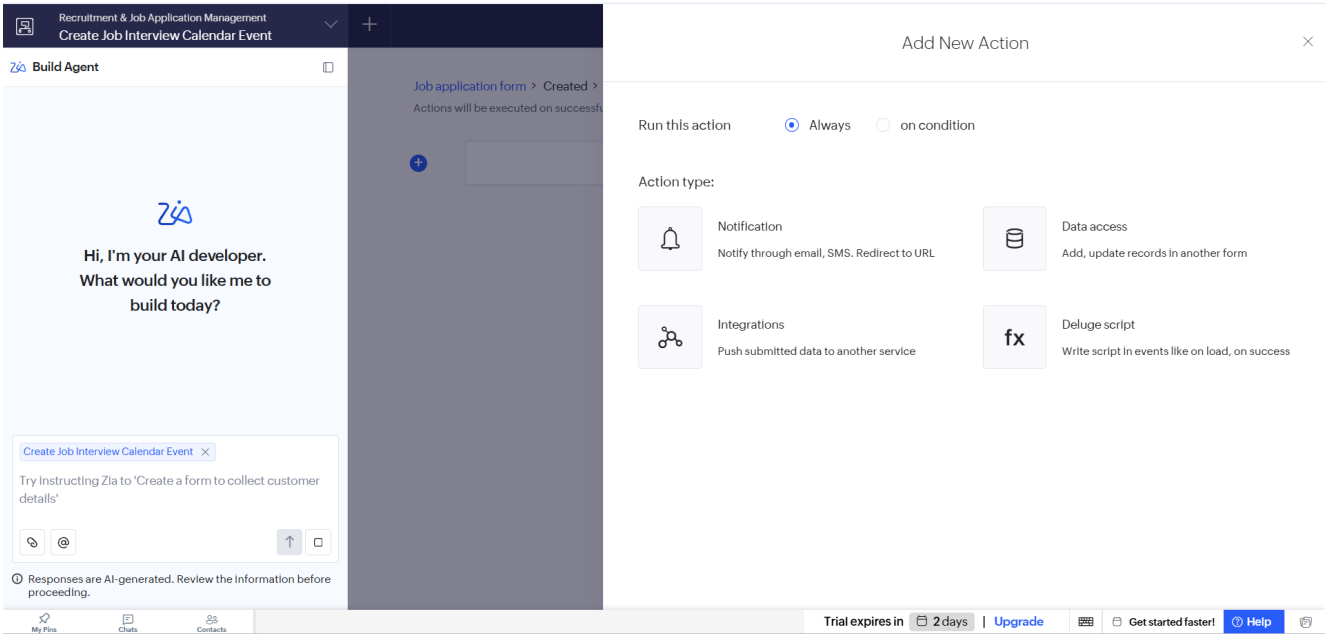

Figure 1. Add New Action window for the Create Job Interview Calendar Event workflow, showing the Deluge script option.

Figure 2 - Deluge Script and Debugging

Figure 2. Deluge editor displaying a function-name error on line 22 during configuration. The function call was subsequently corrected during the exercise.

Figure 3 - Zoho Calendar Verification Screen

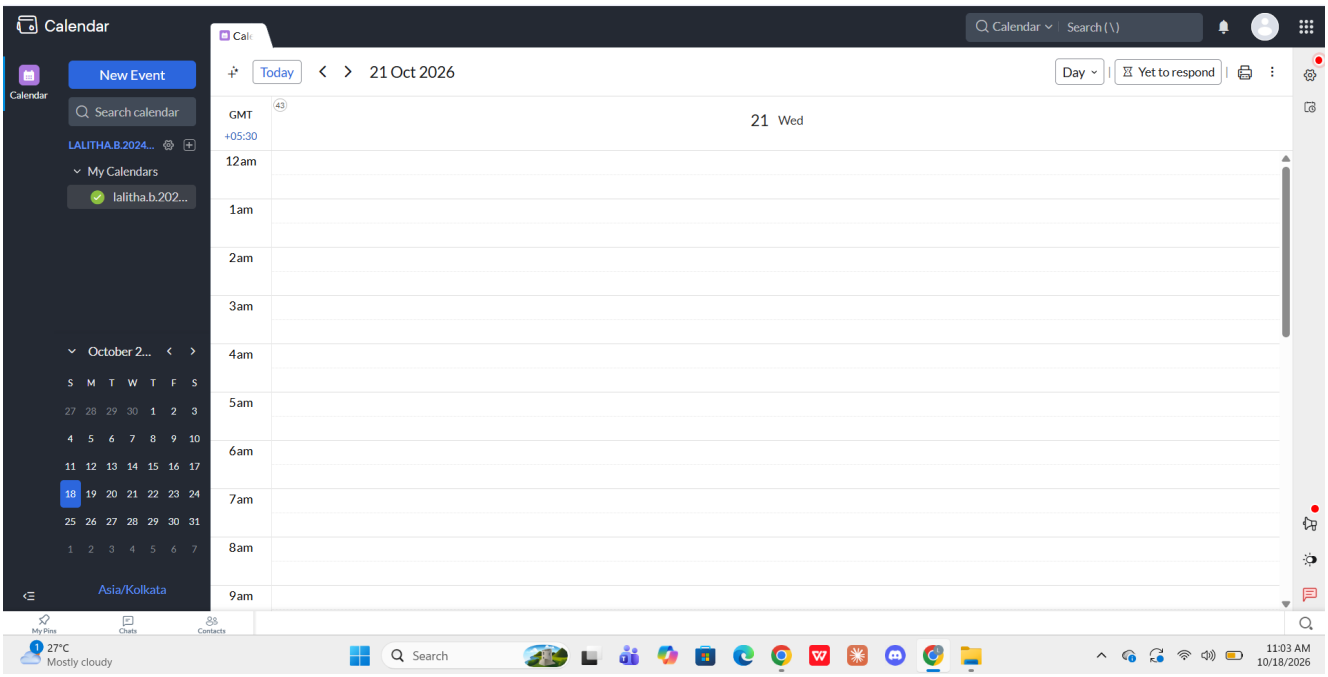

Figure 3. Zoho Calendar day view with the My Calendars section visible, used to inspect the interview schedule.

7. Testing and Debugging

During script configuration, the editor reported that the function job_interview_calendar_connection could not be found. This occurred because a connection link name had been placed in the position of the Zoho Calendar API function. The intended call uses zoho.calendar.createEvent with the authorized connection link name as an argument. The user reported that the edited script no longer produced a save-time error.

The Calendar screenshot shows the connected user calendar interface, but no interview event is visible in the displayed day view. Accordingly, the available screenshots do not establish that an event was successfully created. The integration should be confirmed by submitting a fresh sample record, checking the exact proposed interview date and reviewing workflow execution details if no event appears.

8. Result

The Zoho Calendar integration workflow was configured in the Recruitment & Job Application Management application, and the Deluge action was edited to address a function-name error. The Calendar interface was opened for verification. Successful automatic creation of an interview event remains to be verified from the supplied evidence.

9. Conclusion

This experiment demonstrates the process of connecting Zoho Creator to another Zoho service using Microservices, authorized Connections, workflows and Deluge scripting. It also illustrates the importance of correct API function names, connection link names and runtime testing. Once event creation is verified, this integration can reduce manual effort in maintaining proposed recruitment interview schedules.
