EXPERIMENT – 6

Automating Business Processes Using Deluge Scripting and Workflows, with Application Testing and Debugging

Recruitment & Job Application Management

Student Name	Lalitha B
Roll Number	241401045
Department	Computer Science and Business Systems (CSBS)
Experiment Number	6
Platform	Zoho Creator
Application Name	Recruitment & Job Application Management
Form Name	Job application form
Workflow Name	Send Job Application Confirmation Email

1. Aim

To automate the job application acknowledgement process by sending an email automatically to a candidate after successful submission of the Job Application Form, using a Zoho Creator workflow and Deluge script. This reduces the need for manual acknowledgements and confirms that the candidate's application has been received.

2. Problem Statement

During recruitment, candidates often need confirmation that their applications have been submitted successfully. Sending individual acknowledgement emails manually takes time and can lead to inconsistent communication. A workflow linked to the Job Application Form can automatically send a personalized email with the submitted details.

3. Procedure

Step 1 – Create a Workflow: Open the existing Recruitment & Job Application Management application, enter the application builder, navigate to Workflows, and create a workflow for the Job application form.

Step 2 – Configure the Trigger: Set the record event to Created and the form event to Successful form submission, so the workflow executes when a new application is submitted successfully.

Step 3 – Name the Workflow: Enter Send Job Application Confirmation Email and create the workflow.

3. Procedure (continued)

Step 4 – Add a Deluge Action: Select Add New Action, keep Always selected, and choose Deluge script as the action type.

Step 5 – Write the Deluge Script: Use the sendmail statement to email the candidate at the address entered in the form. The script inserts submitted fields dynamically, including Department Applied For, Employment Type, Years of Experience, Available Joining Date and Preferred Interview Time.

Step 6 – Save the Script: Convert the time field into text using .toString() so it can be included in the message. Save or update the script and complete the workflow configuration.

Step 7 – Test the Application: Submit a new record through the Job application form with valid candidate details and an accessible email address.

Step 8 – Debug and Verify: Check the candidate's email inbox for the automated acknowledgement. Verify the subject and the submitted department, employment type, experience, joining date and interview time.

4. Workflow Summary

Candidate submits Job Application Form → Successful submission triggers the workflow → Deluge sendmail action retrieves the submitted information → Acknowledgement email is delivered to the candidate.

5. Implementation Evidence / Output

The following four screenshots document workflow setup, Deluge action selection, script implementation, and the successfully received confirmation email.

5. Implementation Evidence / Output (continued)

Figure 1

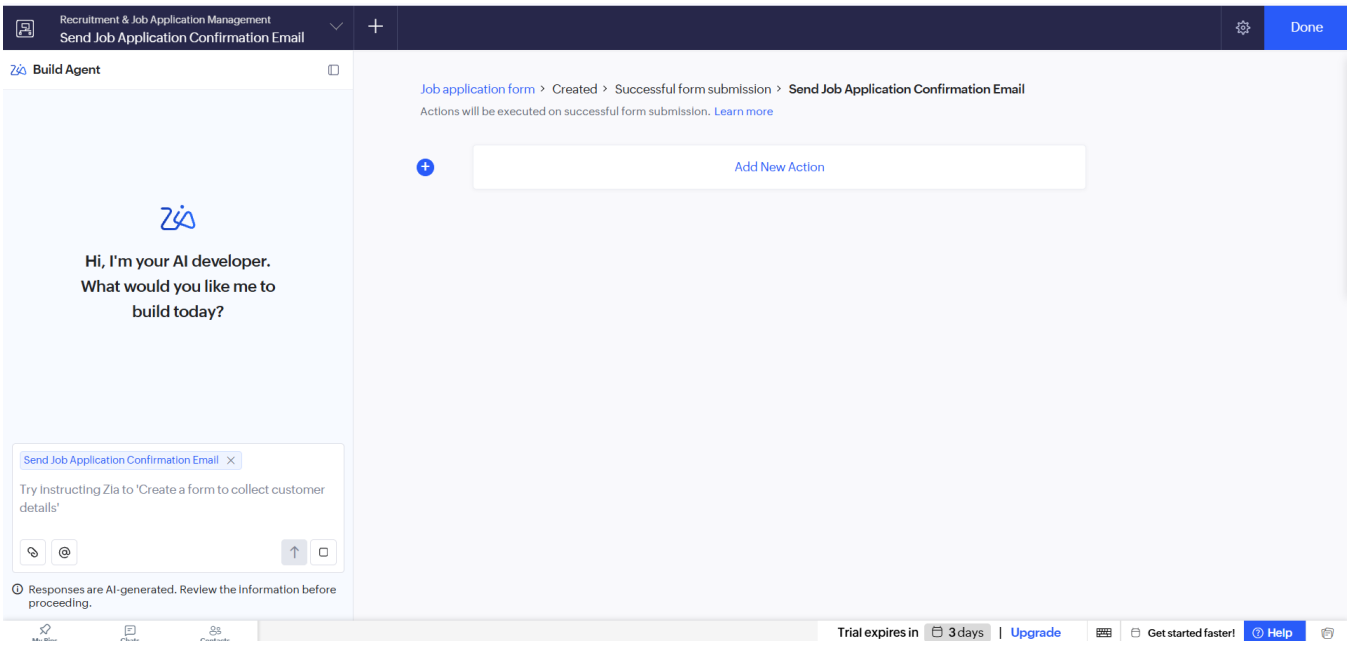

Figure 1 – Workflow setup: The job application submission workflow is configured for the Created event and successful form submission.

5. Implementation Evidence / Output (continued)

Figure 2

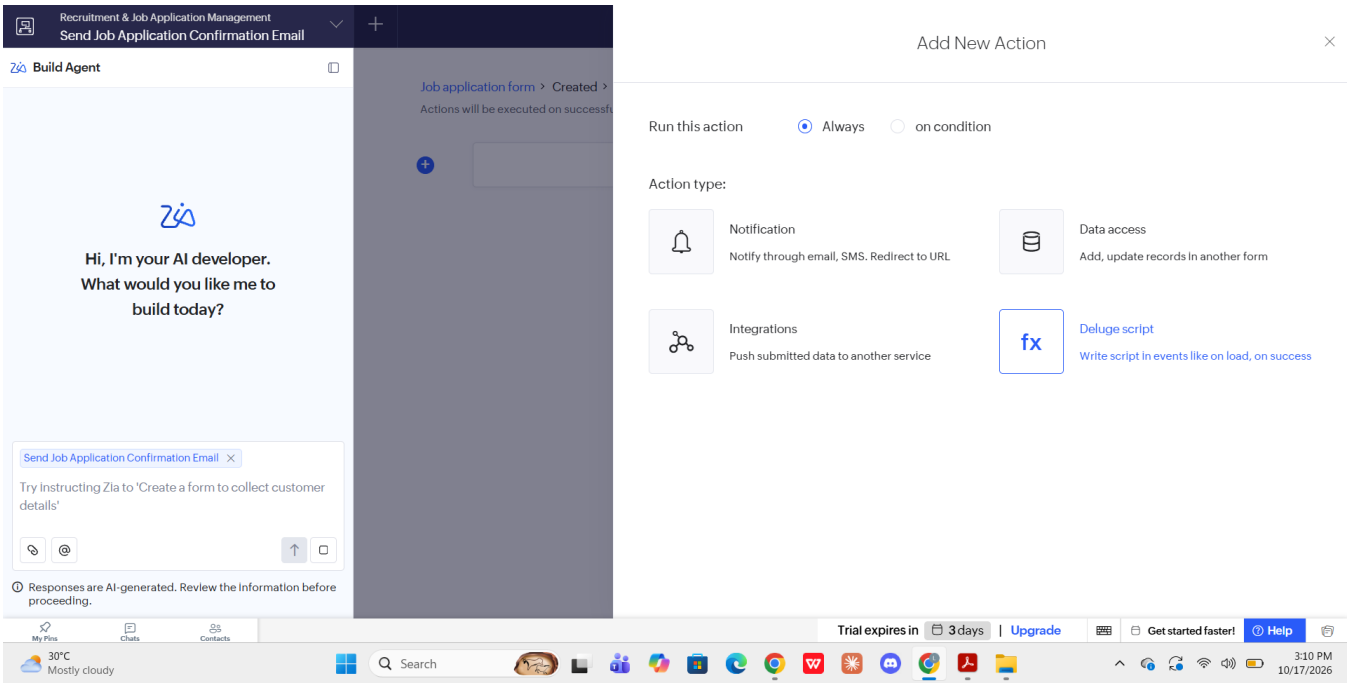

Figure 2 – Choosing the action: The Deluge script option is selected in the Add New Action panel.

5. Implementation Evidence / Output (continued)

Figure 3

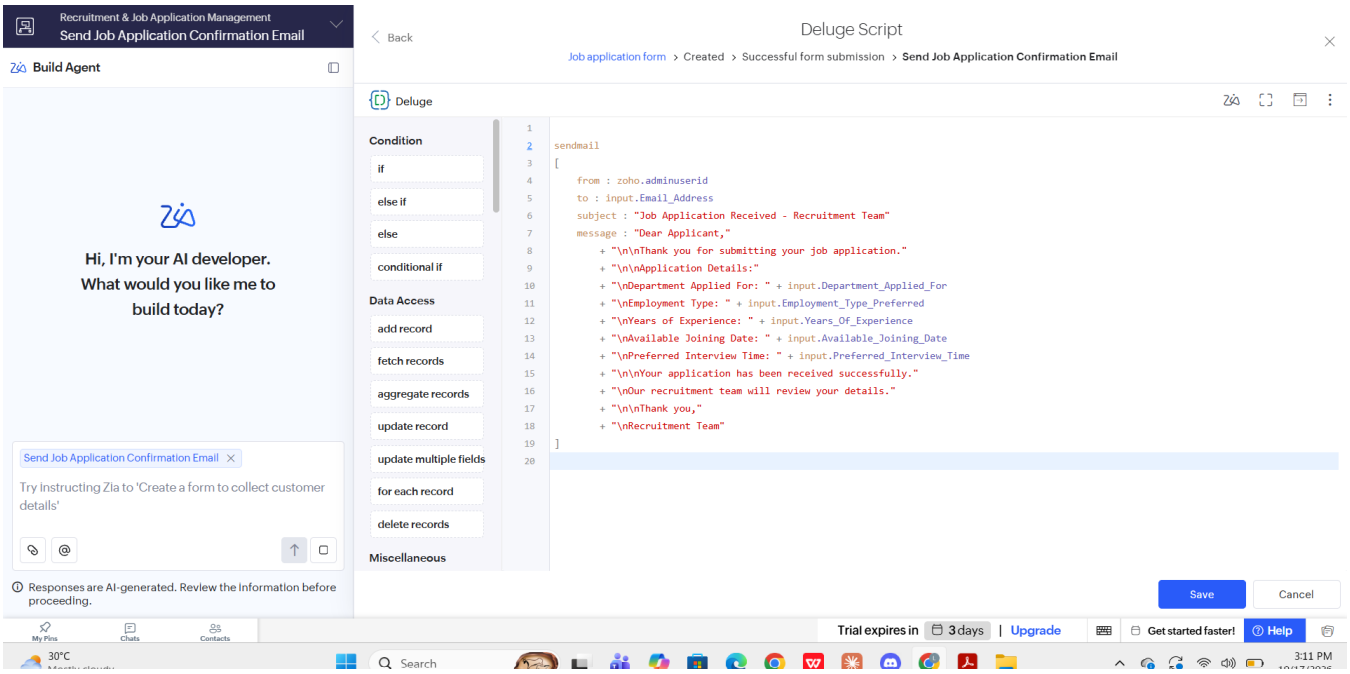

Figure 3 – Deluge script: The sendmail statement prepares an acknowledgement using form-field values.

5. Implementation Evidence / Output (continued)

Figure 4

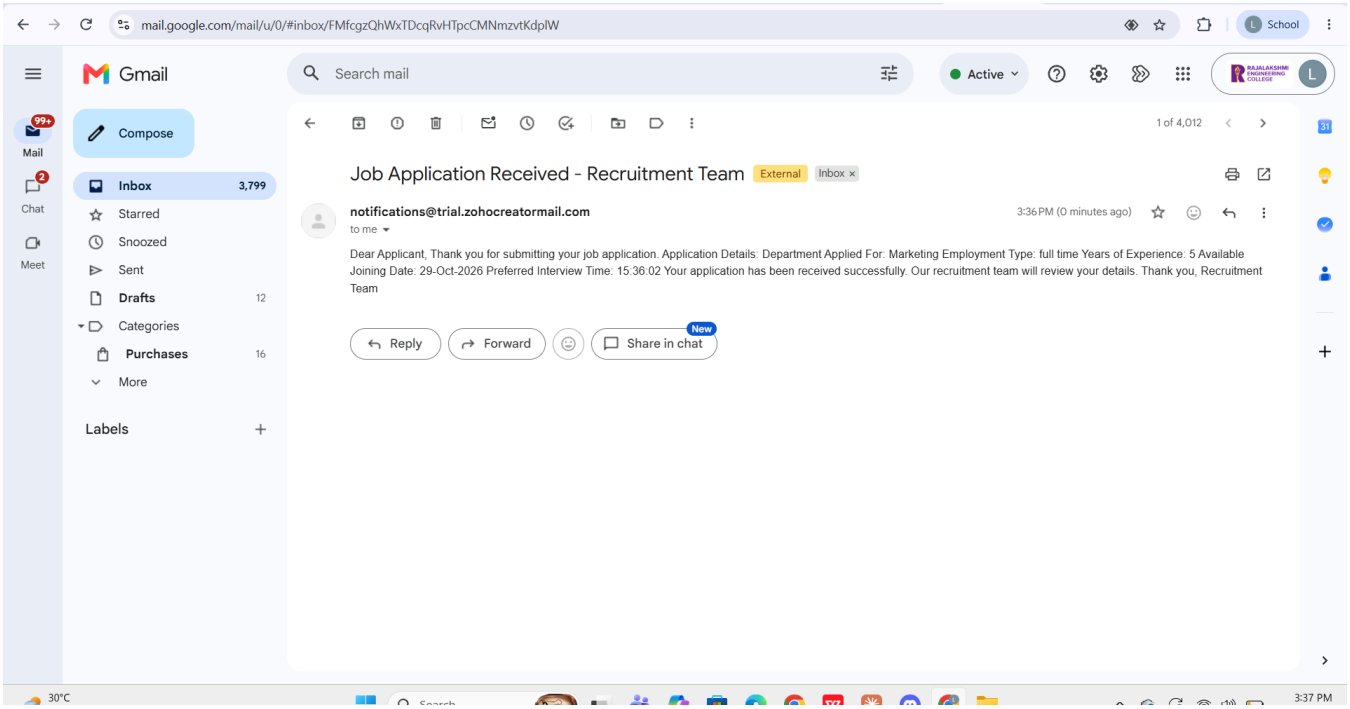

Figure 4 – Confirmation email: The candidate inbox shows the email received with submitted application details.

6. Result

The workflow was successfully tested for the Recruitment & Job Application Management application. After a new job application was submitted, a confirmation email was received from Zoho Creator. The message displayed the department applied for, employment type, years of experience, available joining date, and preferred interview time, confirming that the automatic acknowledgement was functioning.

7. Conclusion

This experiment demonstrates how Zoho Creator Workflows and Deluge scripting can automate routine recruitment communications. By sending application acknowledgements automatically after successful form submission, the application provides prompt confirmation to candidates and reduces manual work for the recruitment team.
